VELOCITYX

AI TRADING PLATFORM

OFFICIAL USER GUIDE

Your complete guide to smart trading

Every screen, every button and every feature explained step by step, in simple words. You do not need any trading or computer experience to follow this guide.

Crypto | NSE Stocks | NSE Forex | NSE Options | AI Bots | Copy Trading

Edition 1.0 · November 2026

For customers & platform owners

INSIDE THIS GUIDE

Contents

Read Chapters 1 to 3 first. They take about 15 minutes and keep your money safe.
After that, jump to any chapter you need.

1 **Before You Start**
What VelocityX is, easy words, Paper vs Live, golden safety rules

2 **Getting Started**
Create your account, sign in, tour of the screen, install on phone

3 **Connect Your Exchange**
Make Binance API keys and connect them safely

4 **Watch the Market**
Dashboard, Portfolio AI, AI Terminal, AI Scanner, Market Intel

5 **Trading Bots**
Create, start, stop and read your AI bots, strategies explained

6 **More Ways to Trade**
Copy Trading, NSE Options, Strategy Library, Marketplace

7 **Test & Learn**
Backtest Lab, AI Assistant, Trade Journal, Learning Loop

8 **Safety & Your Account**
Risk Manager, Kill Switch, History, 2FA, Telegram, plans

9 **For the Platform Owner**
Admin Panel, Super Admin, plans and customer approvals

★ **Help Section**
Common problems & fixes, word meanings, safety checklist

How to read this guide. Numbered gold circles are steps — do them in order. **Gold boxes** are buttons you click. **Purple words** are menu names on the left side of the screen.

CHAPTER 01

Before You Start

Five minutes of reading here will save you from the most common and costly mistakes.

What is VelocityX?

VelocityX is a website (and phone app) that helps you **buy and sell** crypto coins, Indian stocks, forex and options. It has a built-in **AI (artificial intelligence)** that studies the market every few minutes and tells you whether it is a good time to buy, sell or wait.

You can trade in two ways:

✋ By yourself
You look at the AI's advice and click Buy or Sell yourself in the **AI Terminal**.

🤖 With a bot
You create a "bot" — a robot helper. It watches the market 24 hours a day and trades for you, following safety rules.

Easy words you will see

WORD	SIMPLE MEANING
Coin / Pair	What you trade. **BTCUSDT** means Bitcoin priced in USDT (a digital dollar).
Exchange	The market shop where trades really happen, for example **Binance** or **Zerodha**.
Paper mode	Practice with **fake money**. Nothing real is bought. Safe for learning.
Live mode	Trading with **real money** from your exchange account.
Stop-loss (SL)	An automatic "sell" if the price falls too much. It stops a small loss from becoming a big loss.
Take-profit (TP)	An automatic "sell" when the price reaches your profit target.
Bot	A robot helper that trades for you using a strategy.
Strategy	The rule book the bot follows to decide when to buy and sell.
PnL	Profit and Loss. **Green** = profit, **Red** = loss.

More words are explained in the Help Section at the end of this guide.

Paper mode vs Live mode

Paper (practice)
Fake wallet with fake money. Perfect for learning. You can never lose real money here. **Always start here.**

Live (real money)
Uses the exchange account you connected. Profits and losses are real. Only use after practising in Paper mode.

You switch between them with the **Paper / Live** button at the top of the screen. When Live is on, a yellow warning bar is shown on every page so you never forget.

The 6 golden safety rules

1. **Practise first.** Use Paper mode for at least 1–2 weeks before using real money.
2. **Only use money you can afford to lose.** Trading always has risk. No AI can promise profit.
3. **Never turn on "Withdrawals"** when you make exchange API keys. VelocityX never needs it.
4. **Never share** your password, API secret or 2FA code with anyone — not even support staff.
5. **Turn on Two-Factor Authentication (2FA)** on your VelocityX account and on your exchange.
6. **Know the Kill Switch.** The red Kill Switch button at the top stops everything instantly in an emergency.

CHAPTER 02

Getting Started

Create your account, sign in and learn where everything is on the screen.

1 Create your account

1. Open the VelocityX website link given to you, in Chrome or any browser.
2. On the sign-in page click **New here? Create an account**.
3. Type a **Username** and a strong **Password** (at least 8 letters, mix numbers and symbols).
4. Click **Create account**. You are now signed in on the **Free plan**.

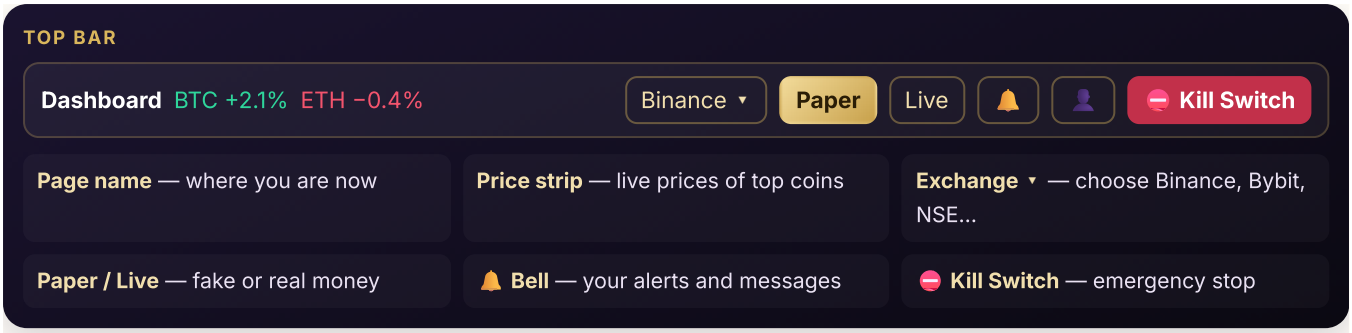

> **Free plan** lets you practise in Paper mode with 1 bot. To trade with real money, upgrade to Pro or Elite (see Chapter 8).

2 Sign in next time

1. Open the website, type your **Username** and **Password**.
2. Click **Sign in**. If you turned on 2FA, type the 6-digit code from your authenticator app.
3. Forgot your password? Click **Forgot password?** and follow the steps. A reset code is sent to your Telegram if you linked it.

3 Tour of the screen

The screen has 3 parts: the **menu on the left**, the **top bar**, and the **main area** in the middle.

The left menu

GROUP	PAGES INSIDE
Overview	Dashboard, Portfolio AI
Trade	AI Terminal, AI Scanner, Options (NSE), Market Intel
Automate	Bot Manager, Copy Trading, Strategy Library, Marketplace, Backtest Lab
Intelligence	AI Assistant, Trade Journal, Learning Loop
Account	Risk Manager, Trade History, Account & Security, Developer API, Settings

💡 On a phone, the menu is hidden. Tap the ☰ button at the top-left, or use the tab bar at the bottom of the screen.

4 Install it on your phone (optional)

1. Open the website on your phone in Chrome (Android) or Safari (iPhone).
2. Android: tap the **Install app** button at the top, or Chrome menu ⋮ → **Add to Home screen**.
3. iPhone: tap the Share button → **Add to Home Screen**.
4. A VelocityX icon appears on your phone. Open it like any normal app.

CHAPTER 03

Connect Your Exchange

To trade with real money, VelocityX needs a "key" from your exchange. Each customer uses their own key, so trades happen only in your own account.

⭐ **What is an API key?** Think of it as a special door key you give to VelocityX. It can place trades for you, but — if you set it up as shown below — it can **never withdraw or move your money out**. You make two things: an **API Key** (like a username) and an **API Secret** (like a password).

A Make your API key on Binance

1. Sign in to **binance.com** (on a computer is easiest). Your Binance account must be verified (KYC).
2. Click your **profile icon** → **API Management**.
3. Click **Create API** → choose **System generated** → give it a name like *VelocityX*.
4. Finish the security check (email / phone / authenticator code).
5. You now see the **API Key** and **Secret Key**. **Copy both and keep them safe.** The Secret is shown only once.
6. Click **Edit restrictions**. Tick **Enable Spot & Margin Trading**. Make sure **Enable Withdrawals is OFF**.
7. Recommended: choose **Restrict access to trusted IPs only** and enter the server IP your platform owner gives you. Click **Save**.

⚠️ **Never** tick "Enable Withdrawals". **Never** send your Secret Key on WhatsApp, email or phone to anyone.

💡 **Want to practise with Binance first?** Make free test keys at **testnet.binance.vision**. These use fake money on Binance's own test system.

B Add the key in VelocityX

1. In the left menu click **Account & Security**.
2. Open the **Exchange connections** tab.
3. In **Exchange** choose **Binance**. (Bybit, OKX and Zerodha are also supported. OKX also needs a **Passphrase**.)
4. Paste your **API key** and **API secret**.
5. **Testnet / demo account** tick box: tick it only if you made test keys. Untick it for real Binance keys.
6. Click **Save connection**. Your secret is locked (encrypted) and never shown again.
7. Click **Test** next to the new connection. You should see **"Connected"** with your number of assets.

Zerodha (NSE stocks, forex and options): add your Kite Connect API key and secret the same way, then click **Log in to Kite**. Kite logins expire every morning around 6 AM, so log in again each trading day.

CHAPTER 04

Watch the Market

These pages show you what is happening, what you own, and what the AI thinks.

Dashboard

WHAT IT IS
Your home page — a quick summary of everything.

USE IT WHEN
You open the app and want a quick look.

- **Top boxes:** your total money, Realized PnL (profit already taken), Win Rate (% of winning trades) and number of Active AI Bots.
- **Fear & Greed Index:** shows if people are scared (Fear) or over-excited (Greed). The AI uses this.
- **Live AI Activity:** what your bots are doing right now.
- **Top Markets by Volume**, **Holdings** and **Recent Trades**.

Portfolio AI

WHAT IT IS
A health check of everything you own.

USE IT WHEN
You want to know if your money is spread out safely.

- **Allocation:** a chart of how your money is split between coins and cash.
- **Portfolio risk** and **volatility:** how much your total value could swing.
- **Correlation Matrix:** shows coins that move together (owning many similar coins is risky).
- **AI Recommendations** and **Warnings:** simple advice, like "too much money in one coin".

AI Terminal — check a coin and trade by hand

WHAT IT IS
A price chart, the AI's advice and a Buy/Sell box.

USE IT WHEN
You want to study one coin or place a trade yourself.

Get the AI's advice

1. Click **AI Terminal**. Click the coin name at the top-left and pick or search a coin (e.g. BTC).
2. Choose a **timeframe** (15m, 1h, 4h, 1d). Bigger timeframes = slower, calmer signals.
3. Click **Run AI Analysis**.
4. Read the result: **BUY**, **SELL** or **WAIT**, the **probability**, the **Market Regime** (type of market), the suggested **Stop-loss** and **Take-profit**, and the **Key Drivers** (reasons).
5. Look at **Risk Manager / Safety gates**: if it says **Rejected**, the safety system does not allow this trade now.

Place a trade yourself

1. Check the top bar: **Paper** for practice, **Live** for real money.
2. In the **Place Order** box choose **Buy** or **Sell**.
3. Type the amount, or tap **25% / 50% / 75% / 100%** of your balance.
4. Click the Buy/Sell button and confirm. Your trade appears in **Trade History**.

> 💡 The chart has extra lines you can turn on or off: EMA lines (trend), Bollinger bands, support/resistance levels and a colour strip that shows the market type.

◎ AI Scanner — find the best coins today

WHAT IT IS
The AI checks 100+ coins and lists the best chances.

USE IT WHEN
You don't know which coin to trade.

1. Click **AI Scanner**. Choose a timeframe and how many coins to check (100 or 150).
2. Click **Scan Market** and wait about a minute.
3. The **Filter Funnel** shows how many coins passed each check (enough trading, right movement, good trend, AI score, safety).
4. **Top Setups** lists the best coins with their **Confidence**, **Quality** grade (A is best) and strategy. Click a coin to open it in the Terminal.

Market Intel

WHAT IT IS

Extra market information the AI also looks at.

USE IT WHEN

Before a big trade, to check news and big players.

- **Coin chips + search box:** pick any coin. Type a name like *PEPE* in the box and click **Add**.
- **Order Flow AI:** are big buyers or big sellers more active right now?
- **Futures Intelligence:** what traders using borrowed money (futures) are doing.
- **News AI:** latest crypto news marked good or bad.
- **Economic Calendar:** big events (US inflation, interest rates). The AI trades smaller around these.

CHAPTER 05

Trading Bots

A bot is your robot trader. It watches the market day and night and follows strict safety rules.

Create your first bot

1. Click **Bot Manager**, then **New Bot**.
2. **Bot name:** any name, e.g. *My BTC Bot*.
3. **Exchange** and **Trading pair:** e.g. Binance and **BTCUSDT**. Any coin on the exchange is allowed.
4. **Timeframe:** how often the bot thinks. **1h or 4h** is best for beginners.
5. **AI strategy:** choose **AI Adaptive** (recommended — it changes its plan when the market changes).
6. **Mode: Paper** to practise. Choose **Live** only when you are ready.
7. Leave the safety numbers as they are for now (see the table below).
8. Click **Create bot**, then click **Start** on the bot card.

Bot settings explained

SETTING	MEANING	BEGINNER VALUE
Base risk %	Most you can lose in one trade, as % of your money.	1%
Max position %	Most of your money one trade can use.	25%
Daily loss limit %	If you lose this much in a day, the bot stops trading until tomorrow.	5%
Trailing stop	When price goes up, the stop-loss also moves up to lock in profit.	ON
Trailing ATR ×	How far the trailing stop stays behind the price. Bigger = more room.	2.5
Signal threshold	How sure the AI must be before buying. Higher = fewer but stronger trades.	30
Allow shorts	Lets the bot earn when prices fall (only where the exchange supports it).	OFF

🧭 How AI Adaptive changes its plan

Every new candle (time period) the AI decides what **type of market** it is and picks the right plan:

MARKET TYPE	WHAT THE BOT DOES
📈 **Bull Trend** (going up steadily)	Uses the **Trend** plan — buys and rides the move up.
🚀 **Breakout / High volatility**	Uses the **Breakout** plan with a smaller amount.
↔️ **Sideways / Low volatility**	Uses **Mean Reversion** — buys low, sells high inside the range.
📉 **Bear Trend / Breakdown / Panic**	**Does not buy.** It waits safely until the market is healthy again.

⚠️ No strategy wins every trade. Losing trades are normal. The goal is that winners are bigger than losers over time. **Profit is never guaranteed.**

Reading the bot card

- A **green border** means the bot is running. Buttons: **Stop**, **Start / Resume**, **Logs**, edit ✎ and delete 🗑.
- **Total PnL**, **Win rate**, and **Last signal** (what the AI decided last and why).
- When the bot holds a coin you see **Avg entry** (buy price), **Stop-loss** and **Take-profit**. Click **Close position** to sell now.
- The top row shows **Bots running**, **Today realized**, **Exposure** (money in trades) and **Drawdown** (drop from your best balance).
- **Logs** show every step in plain words: info, trade, profit, loss / error.

Other bot types

DCA bot

Buys a small fixed amount every few candles (e.g. "Buy every N candles"), then sells when the average price is up by your **Take profit on avg cost %**. Good for long-term saving.

Grid bot

Works in sideways markets: places many small buy-low / sell-high orders inside a price range. It closes itself if the price falls out of the range.

CHAPTER 06

More Ways to Trade

Copy expert traders, trade Indian options, and choose or build strategies.

Copy Trading

WHAT IT IS
Automatically copy the trades of other users' bots.

USE IT WHEN
You want to follow a trader with a good record.

1. Click **Copy Trading** and look at the **Leaderboard** (win rate, profit, followers).
2. Click **Copy** next to a trader.
3. Choose **Mode** (Paper first!), **Size multiplier** (1 = same size, 0.5 = half) and **Max per trade** (USDT limit; 0 = no limit).
4. Confirm. Their new trades are now copied to you. See them under **Who I copy**.
5. Use **Pause** or **Unfollow** any time.

💡 **Share my bots:** you can also list your own bots so others can copy you.

Options (NSE)

WHAT IT IS
Trade NIFTY / BANKNIFTY options with ready-made, limited-risk plans.

NEEDS
A Zerodha connection and a plan that includes Options.

1. Click **Options (NSE)**. Choose an **Underlying** (e.g. NIFTY 50).
2. Open **Chain & builder**. Pick a strategy (e.g. a spread), or choose **AI chooses (auto)**.

3. Look at the payoff chart and the boxes **MAX PROFIT**, **MAX LOSS**, **BREAKEVEN** and **CHARGES**.

4. Set **Lots**, **Take-profit %** and **Stop %**, then place the trade or click **Create bot**.

5. Watch everything in the **Positions** and **Option bots** tabs.

⚠️ Options can lose value fast. Keep **Defined-risk only** turned ON so your maximum loss is always known in advance.

📚 Strategy Library

All built-in strategies with their test results: **Win rate**, **Profit factor** (above 1 = earns more than it loses), **OOS return** (result on data the AI never saw) and **Best timeframe**. Click **Run Benchmark** to test them all again on fresh data.

STRATEGY	BEST FOR
AI Adaptive ⭐	Everyone — switches plan by market type automatically
EMA Trend / AI Trend	Markets going steadily up
AI Momentum / AI Breakout	Fast, strong moves
AI Mean Reversion	Sideways markets
AI Scalping	Many quick, small trades on short timeframes (advanced)
AI Volatility / AI Order Flow / AI Neural Net	Advanced users
DCA	Slow regular buying for long-term holding

Marketplace — build & share strategies

1. Click **Marketplace** → **New strategy**.
2. Give it a **Name** and **Description**. Move the sliders to choose how much each signal matters (they add up to 100%).
3. Set **Stop-loss** and **Take-profit** (in ATR units — bigger number = wider), pick **Timeframes**, and click **Save strategy**.
4. Click **Publish** to share it, or **Install** someone else's. Rate strategies with ★ stars.

CHAPTER 07

Test & Learn

Test ideas on past data before risking money, ask the AI questions, and learn from every trade.

Backtest Lab — test before you trade

WHAT IT IS
Runs a strategy on years of past prices to see how it would have done.

USE IT WHEN
Before you start any new bot.

1. Click **Backtest Lab**.
2. Pick up to 5 **Coins**. Want a coin not shown? Type it in the search box and click **Add**.
3. Pick up to 4 **Timeframes** and a **Strategy**.
4. Leave the other numbers as they are (they include real fees and slippage) and click **Run Backtest**.
5. Read the results (table below). Check the **Trades**, **Walk-forward**, **Monte Carlo** and **By regime** tabs for more detail.

RESULT	WHAT IS GOOD
Avg out-of-sample return	Above 0% — it made money on data it never trained on.
Profitable out-of-sample	The more markets profitable, the better.
Probability of loss	Lower is better (from Monte Carlo — thousands of "what if" runs).
Win rate / Profit factor	Profit factor above 1.2 is good.

ℹ️ Good past results do not promise future profit, but bad past results are a strong warning. Never go Live with a strategy that loses in the backtest.

AI Assistant

Chat with the AI in normal words, like a messaging app. Try questions like:

- "Should I buy Bitcoin today?" · "Why did my bot lose money yesterday?"
- "Explain stop-loss in simple words." · "Which of my bots is doing best?"

Type in the box at the bottom and press Enter. Available on plans that include the AI Assistant.

Trade Journal

Every finished trade is saved automatically with notes: why it was opened, the market type, and the best and worst price during the trade. At the top, **AI Insights** and **Most Common Mistakes** show patterns in your losing trades, so you can avoid them next time.

Learning Loop (advanced)

The AI keeps checking itself: is it as accurate as it claims? Here you can **Train New Model Candidate** on chosen markets, compare results in the **Model Registry**, and promote a better model only if it passes the **Promotion gates** (safety tests). Most users can leave this page alone.

CHAPTER 08

Safety & Your Account

Control your risk, stop everything in an emergency, and keep your account secure.

🛡 Risk Manager

- **Risk Limits:** set the rules every bot must follow — max exposure, daily loss limit, minimum signal quality and more.
- **Emergency Protection:** the system pauses bots on its own after repeated exchange errors, stale data or abnormal prices.
- **System Health:** exchange connection, speed (latency) and last check time.
- **Live stats:** Running bots, Realized today, Exposure and Drawdown from peak.

⛔ The Kill Switch — emergency stop

⚠️ Use it if the market crashes, something looks wrong, or you are not sure. Pressing it will: **stop all bots, cancel open orders, close your positions, and turn off auto-trading.**

1. Click the red **Kill Switch** at the top-right (also on the Risk Manager page).
2. Confirm. A red bar **"Auto-trading halted"** appears on every page.
3. When it is safe again, click **Resume** in the same place.

📜 Trade History

A full list of every trade, with filters **All / Paper / Live**. At the top: **Total trades**, **Win rate**, **Realized PnL** and **Fees paid**. Useful for your records and taxes.

👤 Account & Security

Turn on Two-Factor Authentication (2FA) — strongly recommended

1. Install **Google Authenticator** or **Authy** on your phone.
2. Go to **Account & Security** → **Two-factor auth** tab.
3. Scan the QR code with the app, type the **6-digit code** and confirm.
4. From now on, sign-in also asks for the code from your phone.

Get alerts on Telegram

1. In Telegram, create a bot with **@BotFather** and copy its **Bot token**. Find your **Chat ID** (e.g. using @userinfobot).
2. In the **Telegram alerts** tab, paste the Bot token and Chat ID, and save.
3. You will get messages for trades, profits, losses and warnings. Password-reset codes also come here.

Upgrade your plan

1. Open the **Subscription** tab to see your plan and the other plans.
2. Click **Request Pro** (or Elite) and pay as told by the platform owner.
3. When the owner approves, your plan becomes active and you get a notification.

PLAN	BOTS	LIVE TRADING	AI CHAT	OPTIONS	COPY TRADING
Free	1	—	—	—	—
Pro	10	✓	✓	✓	✓
Elite	100	✓	✓	✓	✓

Default plans shown. Your platform owner may change prices and features.

Other tabs

- **Profile** and **Password & sessions** — change name and password, sign out other devices.
- **API keys** — for developers who connect their own programs (see **Developer API**).
- **Activity log** — every sign-in and important change, so you can spot anything strange.

Settings

See connected exchanges, your **Paper Trading Wallet** (click **Reset paper wallet** to restart your practice money), Claude AI status, server information and the **Add to Home screen** option for phones.

CHAPTER 09

For the Platform Owner

Only the owner sees these pages. Customers can skip this chapter.

Admin Panel (owner login)

- **Overview:** system health, bots running and AI model accuracy across the platform.
- **Bots** and **Trades:** see all customers' bots and trades.
- **Errors & audit:** bot errors and an audit log of important actions.
- **Platform halt:** click **Halt all trading** to stop trading for **every** customer (with a reason they will see). Click **Resume platform trading** to undo.
- **White-label branding:** change App name, Tagline, colours, logo text and support email, then **Save branding**.

Super Admin — plans & customers

Open **/superadmin** on your website and sign in with the separate Super Admin username and password (this login cannot trade).

Approve a customer's upgrade

1. Open the **Requests** tab. Each pending upgrade request is listed.
2. Check you received the payment, then click **Approve** (add a payment note / reference).
3. The customer is notified and their plan starts immediately.

Other jobs

- **Plans:** create or edit plans — name, price, billing period, trial days and features (max bots, live trading, AI chat, options, copy trading).
- **Users & subscriptions:** **Assign plan** manually, **Cancel sub**, or activate users.
- **Payments:** history of all payments. **Overview:** active subscribers, paid subscriptions and estimated monthly revenue (MRR).
- **Account:** change the Super Admin password.

⚠️ **Server safety:** keep the **MASTER_KEY** in the server settings backed up safely. It locks all customers' API secrets. If it is lost, every customer must add their keys again.

HELP SECTION

Problems & Quick Fixes

The most common questions, answered simply.

PROBLEM	WHAT TO DO
"Cannot reach the server" red bar	The website's server is off or your internet is down. Check your internet; if it continues, contact your platform owner.
"No Binance API keys connected"	Add your keys in Account & Security → Exchange connections (Chapter 3).
Connection **Test** fails	Check you copied the full key and secret with no spaces; the Testnet box matches your key type; trading is enabled on Binance; and the server IP is in your Binance IP list.
"...not included in your Free plan"	That feature needs Pro or Elite. Request an upgrade in the Subscription tab.
Bot is running but **not buying**	This is often correct. The market may be in Bear/Panic mode, the signal is not strong enough, the daily loss limit was hit, or the Kill Switch is on. Read the bot's **Logs** for the exact reason.
"Auto-trading halted" red bar	The Kill Switch or a platform halt is on. Click **Resume** when safe (platform halts can only be lifted by the owner).
"Binance is not responding"	The exchange is busy or down. Bots wait automatically and continue when it comes back.
Zerodha / NSE stopped working	Kite logins expire every morning. Go to Exchange connections and click **Log in to Kite** again.
Forgot password	Click "Forgot password?" on the sign-in page. The code comes by Telegram if linked; otherwise contact your platform owner.
I lost money on a trade	Losses are a normal part of trading. Check the Trade Journal to learn why, lower your Base risk %, and keep practising in Paper mode.

Aa Word meanings (glossary)

ATR
How much a price normally moves in one candle. Used to set safe stop distances.

Backtest
Testing a strategy on past prices.

Candle / Timeframe
One block of time on the chart (e.g. 1h = one hour).

Drawdown
How far your balance dropped from its highest point.

EMA
An average price line that shows the trend direction.

Exposure
How much of your money is in open trades right now.

Fear & Greed
A 0–100 score of market mood.

Futures
Trading with borrowed money. Higher risk.

Leverage
Borrowed money that makes profits and losses bigger.

Long / Short
Long = earn when price rises. Short = earn when price falls.

Order book
The list of people waiting to buy and sell at each price.

Out-of-sample (OOS)
Test data the AI never saw while learning. The honest test.

Profit factor
Total wins ÷ total losses. Above 1 means profitable.

Regime
The type of market right now: trend, sideways, panic, etc.

Slippage
Small difference between expected price and actual price.

Spot
Buying the real coin with your own money, no borrowing.

Testnet
Exchange practice system with fake money.

USDT
A digital coin that tries to stay equal to 1 US dollar.

Volatility
How much and how fast the price jumps around.

Win rate
Percent of trades that ended in profit.

PRINT THIS PAGE AND KEEP IT NEAR YOU

Safety Checklist

Before going Live

- ☐ I practised in Paper mode for at least 1–2 weeks
- ☐ I ran a Backtest and the result was positive
- ☐ 2FA is ON for VelocityX and for my exchange
- ☐ My API key has Withdrawals turned OFF
- ☐ My API key is limited to the server IP
- ☐ I set Base risk to 1% or less
- ☐ I know where the Kill Switch is
- ☐ I only use money I can afford to lose

Every day / week

- ☐ Check the Dashboard and bot Logs once a day
- ☐ Read Telegram alerts
- ☐ Zerodha users: log in to Kite each trading day
- ☐ Look at the Trade Journal once a week
- ☐ Check Portfolio AI warnings
- ☐ Check the Activity log for unknown sign-ins
- ☐ Never share my password, secret or 2FA code
- ☐ When unsure — press the Kill Switch

⚠️ **Risk notice.** Trading crypto, stocks, forex and options carries a high level of risk and can result in the loss of some or all of your money. The AI gives probabilities, not promises. Past performance does not guarantee future results. VelocityX does not give financial advice. Please trade responsibly.

Trade smart. Trade safe.

Start in Paper mode, let the AI do the hard work, and keep your risk small. Your platform owner is here to help if you get stuck.

VelocityX AI Trading Platform · User Guide Edition 1.0 · November 2026
